

Brief Case

SUMMARY

Hermanson, a leading Pacific Northwest Mechanical Contractor, has experienced substantial growth over the past several years and out-paced some of the capability built into their IT systems and processes. The network was having stability issues, data management was a challenge and remote system access on job sites was not efficient.

Guidacent experts evaluated the client's portfolio of applications, network infrastructure, and needs of the business. The team established a critical path, prioritized a list of urgent projects and developed a long-term plan to allow the IT department to scale with future growth of the company.

These critical issues caused Hermanson business operations to lose confidence in the IT team's ability to support them. Productivity across the company was suffering.

Hermanson engaged Guidacent to conduct a full-scale assessment of the IT systems, processes, and team.

Guidacent's team of engineers and senior consultants stabilized the client's network, deployed some key enterprise applications to the cloud, and hired new IT resources to support the evolving needs of the organization.

The end result increased the productivity of the business, improved efficiency, and renewed the relationship between IT and the rest of the company.

Guidacent employed a unique method of designing and implementing effective IT solutions. A strategic differentiator is our strong network of proven partners that we leverage to bring the best and brightest to your project.

“Guidacent came in with a real sense of urgency. Their team jumped in, developed a plan, executed the plan and gave me the confidence that we can continue to serve our customers.”

– Rick Hermanson, CEO Hermanson, LLP
